

AuditIQ Dashboard Redesign

Enterprise Audit Governance Platform

Overview

AuditIQ is an enterprise audit governance platform designed to help audit teams monitor controls, track accountability, and manage compliance workflows across operational environments. The redesign focused on improving visibility, simplifying high-density data interactions, and enabling faster audit decision-making through a more structured audit workflow experience.

Key Metrics

Total Controls	Pending Controls	Accepted Controls	Failed Controls	Compliance Score
72	20	25	20	86%

Summary View

Auditor-wise Accountability Table

Export

Auditor	Completed	In Review	Approved	Reopened	Overdue
Auditor 1	10	2	3	0	1
Auditor 2	12	1	4	1	0
Auditor 3	10	2	3	0	1
Auditor 4	12	1	4	1	0

Quick Insights

- Auditor 4 has highest WIP controls.
- No controls approved in Pune location.

Role & Scope

- Role: Lead UX/UI Designer
- Timeline: 5 weeks
- Platform: Internal Enterprise Web Application

Focus Areas:

- Workflow Simplification
- Dashboard Architecture
- Information Hierarchy
- User Interface Design
- Stakeholder Collaboration

AuditIQ Dashboard Redesign

The existing audit dashboard supported operational tracking across multiple controls, auditors, review stages, and compliance workflows. However, increasing data density and fragmented workflow visibility made it difficult for audit teams to quickly interpret operational status, monitor accountability, and identify critical actions efficiently.

Fragmented Audit Visibility

Audit status and control tracking were distributed across multiple sections, reducing visibility into critical workflow conditions.

Weak Accountability Clarity

Auditor progress, ownership visibility, and review status lacked clear prioritization, slowing operational monitoring.

High-Density Data Scanning

Large volumes of operational data reduced scanning efficiency and increased cognitive effort during audit reviews.

Limited Workflow Prioritization

Critical actions, overdue controls, & workflow bottlenecks were not surfaced prominently enough for rapid decision-making.

Audit Workflow Visibility Gaps

Operational Impact

Hard to identify what needs attention

Slower tracking of auditor progress

Increased operational effort

Higher risk of overlooked issues

Delayed decision-making & escalations

AuditIQ Dashboard Redesign

UX Audit & Existing Experience Analysis

Weak Information Hierarchy

Existing dashboard sections lacked clear visual prioritization, making critical workflow states difficult to scan efficiently.

Distributed Operational Context

Audit status, ownership visibility, and compliance tracking were fragmented across disconnected interface regions.

Cognitive Overload in Data Interpretation

High-density operational data increased scanning effort and slowed decision-making during audit reviews.

Limited Workflow Prioritization

Critical actions, overdue controls, and escalation indicators lacked sufficient visual prominence.

UX Audit Findings

AuditIQ Dashboard Redesign

Strategic UX Redesign Approach

Based on the UX audit findings, a strategic redesign framework was created to transform the dashboard into a unified, intuitive, and action-oriented audit experience.

Strategic UX Goals

Improve Workflow Visibility

Provide end-to-end visibility of audit progress, review stages & task statuses in a single unified view.

Establish Information Hierarchy

Prioritize what matters most by surfacing critical KPIs, risks, and overdue items prominently with clear visual hierarchy.

Reduce Cognitive Scanning Load

Reduce cognitive load by reorganizing dense data into logical groupings with clear labels, spacing and visual cues.

Improve Accountability Visibility

Increase ownership transparency by showing assignees, due dates and review status across all key activities.

Strategic Redesign Framework

A strategic framework to guide the redesign towards clarity, prioritization and operational efficiency.

AuditIQ Dashboard Redesign

Translating UX Strategy into Interface Improvements

The redesigned dashboard was restructured to improve operational visibility, simplify high-density workflows, and surface critical audit actions through clearer hierarchy, prioritisation, and contextual grouping.

Key UX Improvements

Clearer Information Hierarchy

Critical KPIs, overdue items, and audit summaries were reorganised to improve visibility and scanning efficiency.

Unified Workflow Visibility

Audit progress, findings, ownership, and escalations were consolidated into a more connected operational view.

Prioritised Action Areas

Overdue tasks, risk indicators, and workflow bottlenecks were surfaced more prominently for faster response.

Reduced Cognitive Load

Dashboard sections were simplified through cleaner grouping, spacing, and contextual visual patterns.

Design Transformation: Before vs After

5

Unified Lifecycle Tracking

Audit progress is displayed in a connected, easy-to-understand flow.

Transformation Impact

Faster Audit Monitoring

Key information is easier and quicker to find.

Improved Operational Clarity

Clear hierarchy improves understanding and focus.

Better Escalation Visibility

Risks and overdue items are surfaced instantly.

Reduced Scanning Effort

Cleaner layout reduces cognitive load.

Clearer Accountability

Ownership and review status are clearly visible.

AuditIQ Dashboard Redesign

Visual Showcase

Role:

UX Designer

Timeline:

5 weeks

Platform:

Internal Audit Web App

Highlights:

Revamped a legacy control dashboard for improved efficiency and scannability.

Enhanced control filtering, auditor tracking, and visual hierarchy.

Designed a clean, action-oriented UI for audit teams.

AuditIQ Dashboard – UX Case Study

UX Strategy · Wireframes · Design Thinking · Outcome

Project Context

AuditIQ is a control management platform used by audit teams to track control status, accountability, and compliance. I was tasked with redesigning its dashboard to improve visibility, reduce data clutter, and enhance efficiency in control review processes.

My Role

Sole designer responsible for UX research, wireframes (Balsamiq), high-fidelity UI (Adobe XD), and stakeholder collaboration.

Key Problems Identified

- Unclear control states and poor grouping of filters/actions
- Overwhelming data views and visual inconsistency
- Low adoption of key dashboard modules (e.g. rule configuration)

Design Process

- Analysed legacy dashboard and noted navigation friction
- Conducted informal discussions with 2 power users
- Sketched new layout on paper and iterated on filter positioning
- Designed wireframes in Balsamiq and UI in Adobe XD
- Incorporated feedback from audit leads and finalised UI

UX Highlights

- Optimised layout with top-level KPIs for faster scanning
- Visual grouping of filters and better progress indication
- Added insights and auditor-level breakdown to support decisions

✓ Outcome

- Positive response from senior audit managers
- Higher adoption of control filtering and export features
- Improved confidence in auditor-level progress tracking
