

AuditIQ Dashboard Redesign

Visual Showcase

Role:

UX Designer

Timeline:

5 weeks

Platform:

Internal Audit Web App

Highlights:

• Revamped a legacy control dashboard for improved efficiency and scannability.

• Enhanced control filtering, auditor tracking, and visual hierarchy.

• Designed a clean, action-oriented UI for audit teams.

AuditIQ Dashboard – UX Case Study

UX Strategy · Wireframes · Design Thinking · Outcome

Project Context

AuditIQ is a control management platform used by audit teams to track control status, accountability, and compliance. I was tasked with redesigning its dashboard to improve visibility, reduce data clutter, and enhance efficiency in control review processes.

My Role

Sole designer responsible for UX research, wireframes (Balsamiq), high-fidelity UI (Adobe XD), and stakeholder collaboration.

Key Problems Identified

- Unclear control states and poor grouping of filters/actions
- Overwhelming data views and visual inconsistency
- Low adoption of key dashboard modules (e.g. rule configuration)

Design Process

- Analysed legacy dashboard and noted navigation friction
- Conducted informal discussions with 2 power users
- Sketched new layout on paper and iterated on filter positioning
- Designed wireframes in Balsamiq and UI in Adobe XD
- Incorporated feedback from audit leads and finalised UI

UX Highlights

- Optimised layout with top-level KPIs for faster scanning
- Visual grouping of filters and better progress indication
- Added insights and auditor-level breakdown to support decisions

✓ Outcome

- Positive response from senior audit managers
- Higher adoption of control filtering and export features
- Improved confidence in auditor-level progress tracking
